METES AND BOUNDS

To describe land by "metes and bounds," is to have a known land-mark for a place of beginning, and then follow a line according to the compass needle (or magnetic bearing), or the course of a stream, or track of an ancient highway. This plan has resulted in endless confusion and litigation, as land marks decay and change, and it is a well known fact that the compass needle varies and does not always point due north. For these reasons the present system of subdividing a section has been inaugerated.

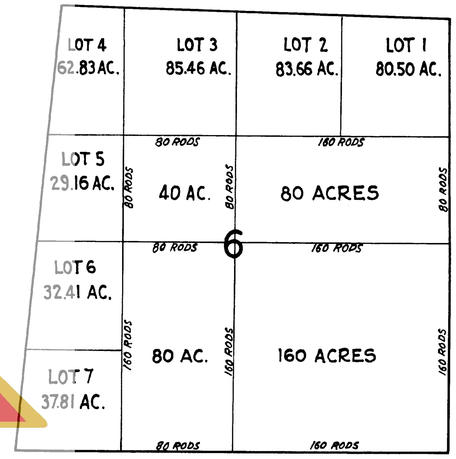

As an example of this plan of dividing lands by "metes and bounds", the following description of a farm is given: "Beginning at a stone on the bank of Doe River, at a point where the highway from A. to B. crosses said river (see point marked "C" in figure 1); thence North 40° West 100 rods to a large stump; thence 10° North of West 90 rods: thence 15° West of North 80 rods to an oak tree (see Witness Tree on Figure 1); thence due East 150 rods to the highway; thence following the course of the Highway 50 rods due North; thence 5° North of East 90 rods; thence 45° East of South 60 rods; thence 10° North of East 200 rods to the Doe River; thence following the course of the River Southwesterly to the place of beginning. This, which is a very simple and moderate description by "metes and bounds" would leave the boundaries of the farm as shown in Figure I.

FRACTIONAL PIECES OF LAND

Townships are the largest subdivisions of land run out by the United States Surveyors and are intended to be six miles square. These Congressional townships, however, vary considerably as to size and boundaries. Errors in surveying and the fact that the meridians converge as they run North from the Equator to the Pole cause every township to vary more or less from the 23,040 acres which a perfect township should contain. In arranging a township all the surplus or deficiency of land is given to, or taken from, the north and west tier of sections. In other words, all sections of a township are made full 640 acres except those on the north and the west, which are given all the land that is left after forming the other 25 sections.

Figure 2 illustrates how the surplus or deficiency of land within these sections is distributed and which "forties" or "eighties" it affects. These fractional tracts are allotted government lot numbers as indicated, such designation being followed by the number of acres contained in the piece of land specified. Besides the government lots created by the convergence of the meridians there are those which are formed by meandered lakes or rivers which may cover a part of a section, by a recent survey approaching a former government survey where the sections adjacent to such former survey are either in excess or fall short of full sections, or by those surveyed sections which are bounded by Indian Reservations, National Parks, mining claims, donation claims, or other private claims.

FIGURE 2

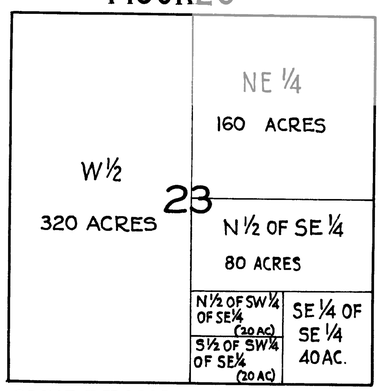

PLAT OF FRACTIONAL SECTION

TABLE OF LAND MEASURE
USED IN GOVERNMENTAL SURVEYS

1 Acre = 43,560 sq. ft. = 160 sq. rods = 10 sq. chains.
1 Mile = 80 chains = 320 rods = 1760 yards = 5,280 ft.
1 Rod = 5½ yards = 16½ ft. = 25 links = 198 inches.
1 Chain = 4 rods = 22 yards = 66 feet = 100 Links.
1 Link = 7.92 inches
144 Sq. inches = 1 square foot
9 Sq. feet = 1 square yard
30¼ Sq. yards = 1 square rod

FIGURE 3

SUBDIVISION OF A SECTION

SUBDIVISION OF A SECTION

Each township, omitting exceptional cases, is comprised of 36 sections. Figure 3 illustrates how a section may be subdivided to facilitate property descriptions and transfers, although the diagram gives only a few of the many subdivisions into which a section may be divided. All sections (except those which are fractional) are supposed to be 320 rods, or one mile square, and therefore contains 640 acres—a number easily divisible. A half section contains 320 acres; a quarter section contains 160 acres; and so on. Each piece of land is described according to the portion of the section which it embraces—as the Northeast quarter of section 23; or the Southeast quarter of the Southeast quarter of section 23; or the North half of the Southwest quarter of the Southeast quarter of the section. This comprehensive system enables one to easily locate the described piece of land and determine its acreage.

The accompanying diagram shows the plan of designating and describing these subdivisions by initial letters, as each parcel of land on the diagram is marked with its description.
